Fixing an Error on the PCB

There are two errors in the layout of the "bezel free" PCB design. Perform step 1 and 3 before you begin populating the circuit board. Do not perform step 2 and 4 until you are finished populating the circuit board.

Step 1:

Cut the trace along the red line. Use a razor blade or small sharp knife.

Step 2:

Do not perform this step until you have finished populating the circuit board. When you are finished populating the circuit board, use a left over piece of lead clipping from the resistors to make a jumper between the two eyelets highlighted in yellow.

Step 3: Cut the trace in two places on the top of the board.

Step 4: Make a jumper to connect these two solder pads. Don't do this step until you've finished populating the circuit board.

Parts Checklist for Tremolo Kit

(revision 2.1 released 11/20/06)

If you have a tremolo kit with an LED bezel, please use the instructions found at www.buildyourownclone.com/treminstructionsV2.pdf

resistors

- 1 180ohm resistor (brown/gray/brown)
- 1 1k resistors (brown/black/red)
- 1 1.2k resistor (brown/red/red)
- 1 4.7k resistors (yellow/purple/red)
- 2 10k resistors (brown/black/orange)
- 1 15k resistors (brown/green/orange)
- 1 150k resistors (brown/green/yellow)
- 2 560k resistor (green/blue/yellow)
- 3 1M resistor (brown/black/green)
- 1 2.2M resistor (red/red/green)

capacitors

- 1 .05uF film capacitor (503k)
- 1 .22uF film capacitor (224k)
- 2 .47uF aluminum electrolytic cap
- 3 .68uF film capacitor (684k)
- 1 10uF aluminum electrolytic cap
- 1 22uF aluminum electrolytic cap

transistors

- 2 2N5088 transistor
- 2 2N5457 JFETs

potentiometers

- 1 25k trim pot
- 1 B1MEG potentiometer
- 1 A25K potentiometer

hardware

- 1 Drilled enclosure
- 1 Ready to solder circuit board
- 1 3PDT footswitch
- 1 Red LED
- 1 Stereo 1/4" jack
- 1 Mono 1/4" jack
- 1 AC adaptor jack
- 2 Black knobs
- 2 Self-adhesive circuit board stand-offs
- 1 Battery snap
- 4 Self-adhesive rubber feet
- Hook-up Wire

Populating the circuit board

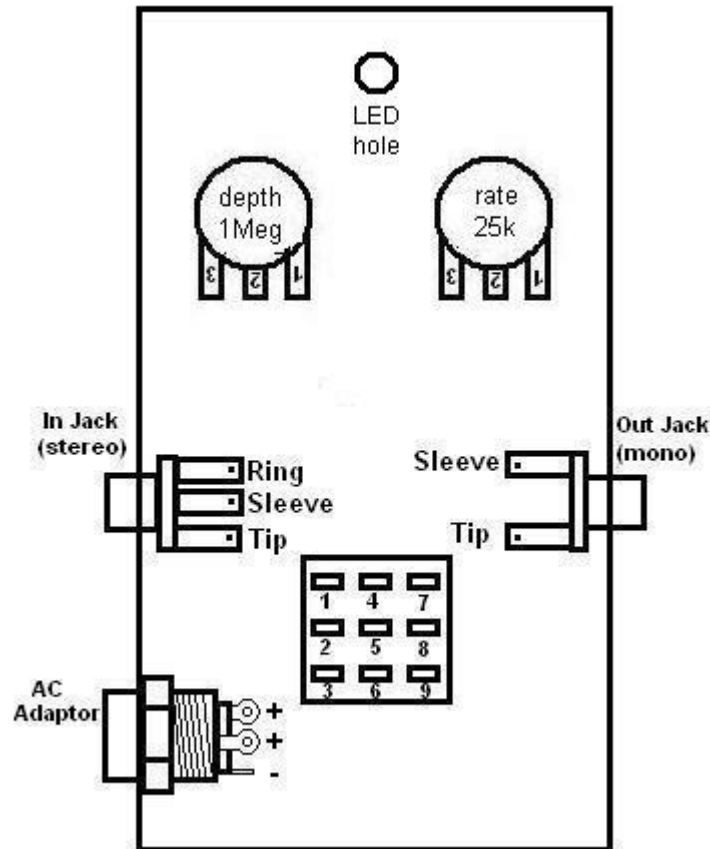

STEP 1: Add all the resistors. There's a lot of soldering here so take your time....If you miss one, it will be nearly impossible to figure out what you did wrong later on. The 1k resistor highlighted in yellow can be changed to a larger value like 2.2k for a slower rate, but you will lose some of the faster “chop”

Step 2: Add the 25k trimpot. This pot controls the volume. When you are finished with the build set it to unity gain.

Assembling the Enclosure

1. Install the jacks first. If you are looking down inside the enclosure, the mono jack goes on the right side and the stereo jack goes on the left. Place the washer on the outside of the enclosure. Use a 1/2" wrench to tighten.
2. Install the AC adaptor jack. The bolt goes on the inside. Use a 3/4" or 14mm wrench to tighten.
3. Install the potentiometers so that the solder lugs are pointing down towards the footswitch side of the enclosure. Use a 10mm wrench to tighten but only snug. Do not over tighten the pots.
4. Install the footswitch. The first bolt and metal washer go inside. The plastic washer and second bolt go on the outside. It does not matter which side you designate as the "leading edge" of the footswitch as long as you orientate it so that the flat sides of the solder lugs are aligned in horizontal rows, not vertical columns. Use a 14mm wrench to tighten

AC Adaptor

This is a “disconnect” ac adaptor jack. That means that when you have a battery connected and you plug in the adaptor, it will disconnect the battery. That is why there are 2 positive terminals. They are both connected when there is no plug in the jack, but when the plug is inserted only one of the terminals (the uppermost terminal in the “back view”) is connected to the sleeve of the adaptor. The advantage of this is that you can leave batteries in your pedals as a back up power source if you are a “working” musician and they will stay fresh even when you have the input jack plugged in as long as you keep the adaptor plugged in.

- then solder.
8. Clip off the excess LED leg wire.

Finishing up & Troubleshooting

1. Test the pedal to make sure it works.
2. Put the cover on and screw it down.
3. Apply the rubber feet.
4. Turn on your amp and rock out.

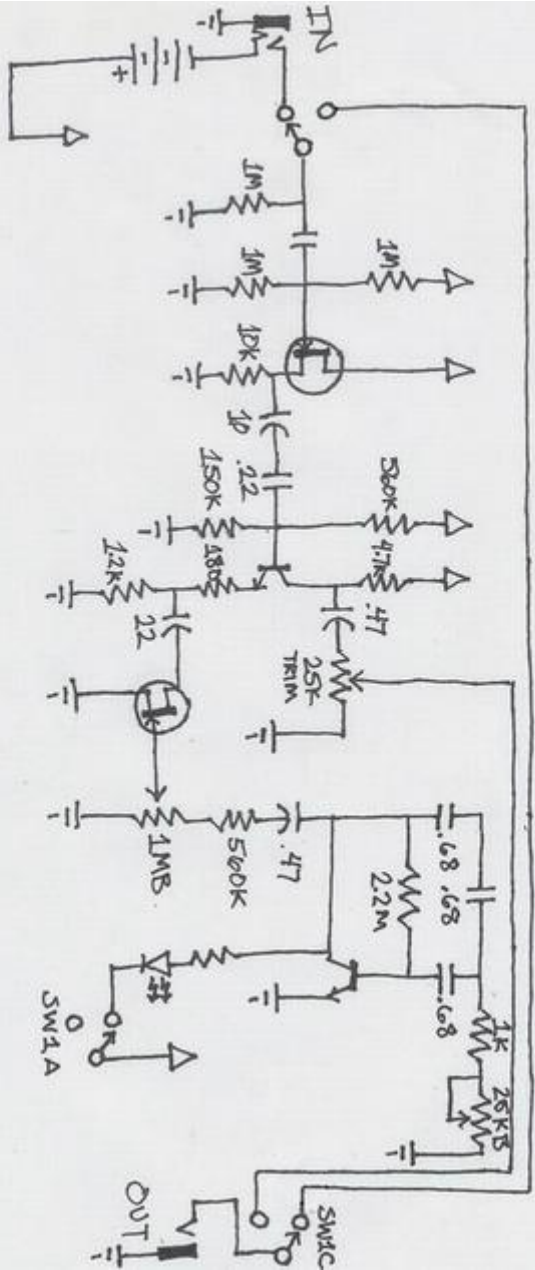

Is your pedal working? Here's a few common mistakes:

1. **No sound at all in either the bypass or on position.** If you aren't getting sound in bypass then you did not wire your footswitch correctly. Getting the bypass to work is the first thing you need to worry about.
2. **Bypass works and the LED lights up when "on", but there's no sound.** You either have a problem with the wiring from the in and/or the out of the circuit board and foot switch. Or you have a problem with something on the circuit board.
3. **Bypass works, but there's no sound when on and the LED does not come on.** You probably aren't getting any power to the circuit. Check all the black and red wires.

If none of this helps, and you can't seem to figure out the problem, I always find that it is best to just set the pedal aside for a day or 2 and then come back to it with a fresh pair of eyes. Then the problem usually jumps right out at you....usually.

If you still can't get it working, start a thread on the BYOC forum board.buildyourownclone.com and ask for help.
